Flexible Packaging

Less Resources. Less Footprint. More Value.

This brochure describes several FPA case studies of flexible and alternative packaging systems. The studies identify trends in packaging weight, product-to-package ratio, landfill discards, energy consumption, and greenhouse gas emissions.

The data sources for the FPA case studies include:

- The FPA Sustainability Assessment of Flexible Packaging 2009 research report produced by Battelle Memorial Institute. Battelle used a streamlined life cycle assessment (LCA) to identify trends in energy consumption and greenhouse gas emissions.
- PE Americas analysis of readily available data. This PE Americas analysis was not critically reviewed per ISO 14040 standards and represents the magnitude of the comparative environmental profiles.
- Other data sources as footnoted.

The FPA case studies describe representative systems which include plausible assumptions for other packages and therefore may be generalized to discuss the advantages of flexible packaging over alternative packaging.
Beverage Packaging

Beverages have typically been packaged in aluminum cans, glass, or plastic bottles. Stand-up flexible pouches are making inroads in packaged juices and fruit drinks.

- The flexible beverage pouch consumes 1/2 the amount of energy compared to the closest alternative.
- The flexible beverage pouch generates 75% less emissions than the closest alternative.
- Stand-up flexible pouches significantly reduce greenhouse gases released and energy consumed during the transport of unfilled packaging from packaging converter to filling operation.

### Raisin Packaging

- Stand-up flexible pouches are 37% less by weight compared to bag-in-a-box packaging.
- Per 100 g of product, bag-in-a-box packaging produces approximately 3 times more MSW than stand-up pouches.
- A flexible pouch consumes about 54% less energy over its life cycle than the next most efficient package.
- Energy consumption during transportation is significantly less for flexible packaging than alternatives.

Parcel Mailer

There are two forms of mailers commonly used: recycled paperboard and HDPE flexible pouches.

- The flexible pouch consumes approximately 1/3 the energy of the alternative to produce, ship, and use.
- The flexible pouch generates approximately 1/2 the CO₂ emissions of the alternative.
- Recycled paperboard mailers produce 7 times more landfill waste by weight per 100 g of product than HDPE flexible pouch mailers (taking into consideration a 27.3% recovery rate of paperboard).
- The flexible pouch mailer uses 1/8 the amount of packaging per 100 g of product vs. the paperboard mailer.

## Multi-unit Packaging

Flexible collation shrink wrap packaging reduces product shift in transit, decreasing breakage and/or product waste.

- The flexible shrink wrap consumes 35% less energy than the alternative.
- Compared to paperboard folding containers (such as in this study), flexible shrink wrap provides an 81% reduction in packaging weight.
- Flexible shrink wrap packaging (in this comparison) offers 5 times more product-to-packaging ratio.

Coffee Packaging

Coffee packaging includes metal cans, rigid plastic containers, and the flexible “brick pack.”

- The flexible brick pack consumes 1/4 of the energy used by alternate packaging.
- The flexible brick pack generates 75% less emissions than the closest alternative.
- The energy savings equivalent of changing all steel coffee cans to flexible brick packs is more than 17,200,000 gallons of gasoline per year.
- The flexible brick pack contains 88% less packaging by weight when compared to metal cans.¹
- The flexible brick pack reduces the weight of waste to landfill by 72% vs. metal cans (taking recycling rates of cans into account).²
- Flexible brick packs use 20% less space in shipping than cans,² reducing transportation emissions.

Foodservice #10 Packaging

Flexible pouch packaging is an alternative to metal cans for a wide range of foodservice applications. The flexible foodservice pouch eliminates sharp edges and offers dispensing fitments and product visibility.

- The flexible foodservice pouch consumes 75% less energy than the metal can.
- The flexible foodservice pouch generates 1/10 the CO₂ emissions of the metal can.
- The flexible pouch is less than 1/10 the packaging weight of the metal can.
- Each case of #10 flexible pouches with finished product utilizes 30% less volume than a case of #10 cans.

Rotisserie Chicken Packaging

Ready-to-eat rotisserie chickens have traditionally been packaged in rigid dome containers. Innovative technology now allows a flexible package to perform in a deli hot case for freshly prepared foods while reducing environmental impacts.

- Eighty-eight percent less fossil fuel is used, and 85% fewer CO₂ emissions are generated during the manufacturing of flexible pouches.¹
- The fossil fuel equivalent of changing a year’s worth of rigid dome rotisserie chicken packaging to flexible pouches would save enough gas to drive around the world 1,475 times.²
- The flexible pouch uses 91% less space by case in shipping. More than 12 truckloads of rigid containers are needed to ship the same amount of Hot N Handy® pouches contained in one 53’-long truckload.³
- The flexible pouch offers a 2/3 reduction of solid waste by weight introduced in landfills versus rigid dome packaging.¹
- The flexible pouch offers value-added features such as a built-in handle, a resealable zipper, and being microwaveable and hot case ready.

FLEXIBLE PACKAGING OFFERS EXCEPTIONAL ENVIRONMENTAL BENEFITS TO CONVERTERS, MANUFACTURERS, RETAILERS, AND CONSUMERS. OVER ITS LIFE CYCLE, FLEXIBLE PACKAGING GENERALLY USES LESS ENERGY AND FEWER RESOURCES, PRODUCES LESS CO₂ EMISSIONS, SIGNIFICANTLY IMPROVES PRODUCT TO PACKAGE RATIO, REQUIRES FEWER TRUCKS ON THE ROAD FOR TRANSPORT, AND PROVIDES NUMEROUS SAFETY AND CONSUMER CONVENIENCE FEATURES. FLEXIBLE PACKAGING IS AN EXCELLENT SUSTAINABLE CHOICE; CREATING MORE VALUE AND LESS FOOTPRINT.
